Senior Engineer — AI Platform, Tooling & Enablement

Software engineer with 10+ years shipping customer-facing products to production, now focused on AI platform work: the tooling, agentic coding workflows, and internal practices that let both engineers and non-engineers get real value out of AI. Delivered real-time conversational AI to enterprise clients at Soul Machines, architected and led React/React Native platforms at Volume Media, and drove agentic coding adoption inside a production codebase. Equally comfortable pitching an AI bet to leadership and building the thing myself in TypeScript, Node, and AWS/GCP.

TECHNICAL SKILLS

AI & Platform: LLM application patterns (RAG, prompt & context engineering, evals), agentic coding tooling (Cursor, Claude Code, MCP servers, custom agents & skills), conversational / avatar-driven AI integration, AI observability (prompt & response logging, token-spend tracking, regression evals)

Languages: TypeScript, JavaScript (ES6+), SQL, HTML5, CSS3/SASS

Frameworks & Libraries: React, React Native, Redux, Node.js, Angular, Jest, Cypress, Storybook

Cloud & DevOps: AWS, Google Cloud Platform, CI/CD pipelines, Docker, Yarn, Gradle

Practices: AI-assisted development workflows, component-driven design systems, data visualization, automated testing

PROFESSIONAL EXPERIENCE

Volume Media | Los Angeles, CA (Remote) | *Front-end Engineering Lead* | Mar 2022 – June 2026

- **Brought agentic coding into the team's workflow**, evaluating successive generations of coding models and establishing the prompting and review patterns that made them safe to run against production code — offloading boilerplate and routine implementation work and cutting feature turnaround by [X%].
- **Turned a hackathon prototype into a shipped production feature**, pitching the idea to leadership and then delivering it on a compressed timeline.
- **Architected and launched multiple React and React Native applications**, owning the full lifecycle from initial wireframes through production and legacy support for [N] users.
- **Built the component design system in Storybook** with Chromatic snapshot testing, giving designers and other non-engineers a self-serve way to review UI before it reached production.
- **Owned software integration strategy**, evaluating third-party APIs and internal tools against build-vs-buy tradeoffs to keep the application scalable.
- **Solved high-latency video delivery** with advanced chunking techniques, holding playback fidelity for users on poor connections.
- **Mentored junior developers** into independent contributors, ramping them on an unfamiliar codebase and modern tooling.

Soul Machines | Auckland, NZ (Remote) | *Sr. Software Engineer* | May 2021 – Mar 2022 (Contract)

- **Shipped the customer-facing web applications that delivered "Digital Personas"** — real-time conversational AI avatars — to enterprise clients, tuning the interaction loop to keep perceptible latency to a minimum.
- **Led technical integration across complex client ecosystems**, bridging proprietary AI technology and the customer-facing experience: scoping requirements with client stakeholders, then translating them into deployable persona experiences.
- **Ran client-facing AI interactions directly** — demoing and debugging live persona behavior with non-technical stakeholders, and setting honest expectations about what the models could and could not do.
- **Managed multi-cloud deployments** across AWS and GCP, maximizing uptime for a global client base.
- **Modernized legacy interfaces** with agent-driven UI interactions for a more immersive experience.

BryterCX | Aurora, CO (Remote) | *Software Engineer* | June 2020 – May 2021

- **Engineered complex data displays** in Angular, turning massive customer-journey datasets into dashboards that non-technical business users could act on.
- **Partnered closely with UI/UX designers** to implement pixel-perfect, responsive charts and data visualization components under tight sprint deadlines.
- **Founded the "Connections Team,"** an internal program that raised engagement and collaboration scores on company-wide employee satisfaction surveys.

DISH Network | Denver, CO | *Software Engineer II* | May 2019 – June 2020

- **Modernized legacy customer-support systems** onto a React/Redux/Jest stack, significantly improving stability and developer velocity for the support agents who used them daily.
- **Standardized testing protocols** with Cypress and Jest, drastically reducing QA churn.
- **Optimized build processes** with Yarn and Gradle to keep large codebases scalable and testable.

Technergetics | Utica, NY | *Software Engineer I* | August 2017 – May 2019

- **Authored open-source Node.js packages for image annotation**, adopted in specialized data-labeling projects — early hands-on work in the ML data supply chain.
- **Rapidly prototyped proof-of-concept proposals** and presented them to prospective clients, securing contract wins on the strength of the technical demos.

Northern Safety Co. Inc | Utica, NY | *Software Engineer I* | June 2015 – August 2017

- **Built and maintained large-scale data migrations** for an enterprise inventory management system in T-SQL.
- **Refactored legacy code** onto TypeScript, ASP.NET MVC, and AngularJS.

SELECTED PROJECTS

Fleet — Agentic Coding Testbed | React, TypeScript, Supabase, Cursor

- **Built a personal garage-management app** (vehicles, maintenance records, research notes) as a deliberate practice ground for agentic development workflows — the app ships, but the real experiment is the toolchain around it.
- **Encoded coding standards as always-on agent rules** (naming over comments, feature-folder React conventions, client-side Supabase/RLS safety) so generated code follows house style automatically instead of being caught in review.
- **Built five custom agent skills** that automate repeatable workflows end to end: adding a Postgres table with RLS policies, types, and a CRUD feature slice; verifying auth guards and protected routes; applying pending database migrations; and planning sprints against Linear through MCP.
- **Applied subagent delegation** for codebase exploration and scoped feature slices, with Row Level Security enforced on every table and the browser client limited to the anon key.

EDUCATION

SUNY Polytechnic Institute | *Bachelor of Science in Computer Science*

INTERESTS

- **Mountain Biking:** Often found on Colorado trails with my dogs, Solo and Ronin.
- **Avid Lego enthusiast:** On an endless quest for more shelf space.
- **Extremely Amateur Mechanic:** Pursuing automotive perfection on a number of ill-advised project cars.
